

Oxygen makes alternative fuels burn so consistently, you will think you're burning coal.

Inject a breath of fresh oxygen into your kiln, and you'll be able to make alternative fuels burn the way you want. Our in-house specialists and O₂ injection technologies can help you improve combustion and lower your costs. Join others who've achieved many of the following results:

- Increased alternative fuel usage
- Reduced fossil fuel consumption
- Reduced CO₂ emissions
- Better burning zone control
- Improved kiln stability
- More consistent product quality and production rates

For case studies and details on the economics, visit our website.

"We believe Air Products is leading the way in oxygen enrichment technology."

John Carlill,
Managing Director,
Steetley Dolomite
